

Project Initialization and Planning Phase

Date	04 July 2026
Team ID	
Project Name	Rising Waters: A Machine Learning Approach for Flood Prediction
Maximum Marks	3 Marks

Define Problem Statements (Customer Problem Statement Template):

Description:

The core objective of this initiative is to shift flood management from a reactive struggle to a proactive strategy. As developers, we are building an AI-powered flood prediction and early warning system designed to predict flood risks early and dispatch timely alerts to protect vulnerable lives and property.

The critical challenge we face is that floods are inherently complex and notoriously hard to predict accurately, meaning legacy warnings often reach local authorities far too late. We address this fundamental flaw because our architecture leverages advanced machine learning models trained on integrated meteorological parameters, rainfall trends, and environmental data to deliver highly precise, accelerated risk forecasting. Ultimately, this engineering approach ensures we feel entirely confident that our system will empower emergency teams and local communities to prepare days in advance, significantly minimizing the socio-economic impact of devastating flood events.
